

Experiment 7

Student Name: Naina Sharma

UID: 22BCS14742

Branch: CSE

Section: 901-B

Semester: 6th

DOP: 03/3/25

Subject: Java

Subject Code: 22CSH-359

Aim: Create Java applications with JDBC for database connectivity, CRUD operations, and MVC architecture.

Objective: To Create Java applications with JDBC for database connectivity, CRUD operations, and MVC architecture.

Easy Level:

Create a Java program to connect to a MySQL database and fetch data from a single table. The program should:

Use DriverManager and Connection objects.

Retrieve and display all records from a table named Employee with columns EmpID, Name, and Salary.

Code:

```
import java.sql.*;
import java.util.Scanner;

public class EmployeeDatabase {

    private static final String DB_URL = "jdbc:mysql://localhost:3808/test";
    private static final String USERNAME = "root";
    private static final String PASSWORD = "*****";

    public static void main(String[] args) {

        Scanner scanner = new Scanner(System.in);

        while (true) {

            System.out.println("\n=== Employee Management System ===");
            System.out.println("1) View Employee List");
            System.out.println("2) Exit");
```

```

System.out.print("Select an option: ");

int option = scanner.nextInt();

if (option == 1) {
    fetchEmployees();
} else if (option == 2) {
    System.out.println("Goodbye!");
    break;
} else {
    System.out.println("Invalid choice! Please try again.");
}
}

scanner.close();
}

private static void fetchEmployees() {
    String query = "SELECT EmpID, Name, Salary FROM Employee";

    try (Connection conn = DriverManager.getConnection(DB_URL, USERNAME, PASSWORD);
        Statement stmt = conn.createStatement();
        ResultSet rs = stmt.executeQuery(query)) {

        System.out.println("\nEmployee Details:");
        System.out.println("ID | Name | Salary");
        System.out.println("-----");

        while (rs.next()) {
            System.out.printf("%d | %s | %.2f\n", rs.getInt("EmpID"), rs.getString("Name"),
rs.getDouble("Salary"));
        }
    }
}

```

```

    } catch (SQLException ex) {

        System.err.println("Database connection error: " + ex.getMessage());

    }

}

}

```

Medium Level:

Build a program to perform CRUD operations (Create, Read, Update, Delete) on a database table Product with columns:

ProductID, ProductName, Price, and Quantity.

The program should include:

Menu-driven options for each operation.

Transaction handling to ensure data integrity.

Code:

```

import java.sql.*;

import java.util.Scanner;

public class ProductManager {

    private static final String DB_URL = "jdbc:mysql://localhost:3808/test";

    private static final String USER = "root";

    private static final String PASSWORD = "*****";

    public static void main(String[] args) {

        Scanner scanner = new Scanner(System.in);

        boolean running = true;

        while (running) {

            System.out.println("\n===== Product Management =====");

            System.out.println("1) Add Product");

            System.out.println("2) View Products");

            System.out.println("3) Update Product");

```

```

        System.out.println("4) Delete Product");
        System.out.println("5) Exit");
        System.out.print("Choose an option: ");

        int choice = scanner.nextInt();
        scanner.nextLine(); // Clear newline buffer

        switch (choice) {
            case 1 -> addProduct(scanner);
            case 2 -> viewProducts();
            case 3 -> updateProduct(scanner);
            case 4 -> deleteProduct(scanner);
            case 5 -> {
                System.out.println("Exiting application...");
                running = false;
            }
            default -> System.out.println("Invalid option! Try again.");
        }
    }
    scanner.close();
}

```

```

private static void addProduct(Scanner scanner) {
    System.out.print("Enter product name: ");
    String name = scanner.nextLine();
    System.out.print("Enter price: ");
    double price = scanner.nextDouble();
    System.out.print("Enter quantity: ");
    int quantity = scanner.nextInt();

    String sql = "INSERT INTO Product (ProductName, Price, Quantity) VALUES (?, ?, ?)";
}

```

```

try (Connection conn = DriverManager.getConnection(DB_URL, USER, PASSWORD);
    PreparedStatement stmt = conn.prepareStatement(sql)) {

    stmt.setString(1, name);
    stmt.setDouble(2, price);
    stmt.setInt(3, quantity);

    int rowsInserted = stmt.executeUpdate();
    if (rowsInserted > 0) {
        System.out.println("Product added successfully!");
    } else {
        System.out.println("Failed to add product.");
    }
} catch (SQLException ex) {
    System.err.println("Error adding product: " + ex.getMessage());
}
}

```

```

private static void viewProducts() {
    String sql = "SELECT * FROM Product";

    try (Connection conn = DriverManager.getConnection(DB_URL, USER, PASSWORD);
        Statement stmt = conn.createStatement();
        ResultSet rs = stmt.executeQuery(sql)) {

        System.out.println("\nProduct List:");
        System.out.println("ID | Name | Price | Quantity");
        System.out.println("-----");

        while (rs.next()) {

```

```

        System.out.printf("%d | %s | %.2f | %d%n",
            rs.getInt("ProductID"),
            rs.getString("ProductName"),
            rs.getDouble("Price"),
            rs.getInt("Quantity"));
    }
} catch (SQLException ex) {
    System.err.println("Error retrieving products: " + ex.getMessage());
}
}

```

```

private static void updateProduct(Scanner scanner) {
    System.out.print("Enter product ID to update: ");
    int id = scanner.nextInt();
    scanner.nextLine(); // Clear buffer
    System.out.print("Enter new product name: ");
    String name = scanner.nextLine();
    System.out.print("Enter new price: ");
    double price = scanner.nextDouble();
    System.out.print("Enter new quantity: ");
    int quantity = scanner.nextInt();

    String sql = "UPDATE Product SET ProductName=?, Price=?, Quantity=? WHERE ProductID=?";

    try (Connection conn = DriverManager.getConnection(DB_URL, USER, PASSWORD);
        PreparedStatement stmt = conn.prepareStatement(sql)) {

        stmt.setString(1, name);
        stmt.setDouble(2, price);
        stmt.setInt(3, quantity);
        stmt.setInt(4, id);
    }
}

```

```

int rowsUpdated = stmt.executeUpdate();
if (rowsUpdated > 0) {
    System.out.println("Product updated successfully!");
} else {
    System.out.println("Product ID not found.");
}
} catch (SQLException ex) {
    System.err.println("Error updating product: " + ex.getMessage());
}
}

```

```

private static void deleteProduct(Scanner scanner) {

```

```

    System.out.print("Enter product ID to delete: ");

```

```

    int id = scanner.nextInt();

```

```

    String sql = "DELETE FROM Product WHERE ProductID=?";

```

```

    try (Connection conn = DriverManager.getConnection(DB_URL, USER, PASSWORD);

```

```

        PreparedStatement stmt = conn.prepareStatement(sql)) {

```

```

        stmt.setInt(1, id);

```

```

        int rowsDeleted = stmt.executeUpdate();

```

```

        if (rowsDeleted > 0) {

```

```

            System.out.println("Product deleted successfully!");

```

```

        } else {

```

```

            System.out.println("Product ID not found.");

```

```

        }

```

```

    } catch (SQLException ex) {

```

```

        System.err.println("Error deleting product: " + ex.getMessage());

```

```
    }  
    }  
}
```

Hard Level:

Develop a Java application using JDBC and MVC architecture to manage student data. The application should:

Use a Student class as the model with fields like StudentID, Name, Department, and Marks.

Include a database table to store student data.

Allow the user to perform CRUD operations through a simple menu-driven view.

Implement database operations in a separate controller class.

Code:

Model

```
public class Student {  
    private int id;  
    private String fullName;  
    private String dept;  
    private int score;  
  
    public Student(int id, String fullName, String dept, int score) {  
        this.id = id;  
        this.fullName = fullName;  
        this.dept = dept;  
        this.score = score;  
    }  
  
    // Getters and Setters  
    public int getId() { return id; }  
    public void setId(int id) { this.id = id; }
```

```
public String getFullName() { return fullName; }  
public void setFullName(String fullName) { this.fullName = fullName; }
```

```
public String getDept() { return dept; }  
public void setDept(String dept) { this.dept = dept; }
```

```
public int getScore() { return score; }  
public void setScore(int score) { this.score = score; }
```

@Override

```
public String toString() {  
    return "Student ID: " + id + ", Name: " + fullName + ", Department: " + dept + ", Score: " + score;  
}  
}
```

View

```
import java.util.List;
```

```
import java.util.Scanner;
```

```
public class StudentView {  
    private final StudentController studentController = new StudentController();  
    private final Scanner inputScanner = new Scanner(System.in);  
  
    public void showMenu() {  
        int option;  
        do {  
            System.out.println("\n=== Student Management Portal ===");  
            System.out.println("1. Register Student");  
            System.out.println("2. Display All Students");  
            System.out.println("3. Modify Student Details");  
            System.out.println("4. Remove Student");  
        } while (true);  
    }  
}
```

```

        System.out.println("5. Exit");
        System.out.print("Select an option: ");
        option = inputScanner.nextInt();
        inputScanner.nextLine(); // Consume newline

        switch (option) {
            case 1:
                registerStudent();
                break;
            case 2:
                listStudents();
                break;
            case 3:
                modifyStudent();
                break;
            case 4:
                removeStudent();
                break;
            case 5:
                System.out.println("Closing application...");
                break;
            default:
                System.out.println("Invalid option, please try again.");
        }
    } while (option != 5);
}

```

```

private void registerStudent() {
    System.out.print("Enter Student Name: ");
    String fullName = inputScanner.nextLine();
    System.out.print("Enter Department: ");
}

```

```
String department = inputScanner.nextLine();  
System.out.print("Enter Marks: ");  
int score = inputScanner.nextInt();  
  
Student newStudent = new Student(0, fullName, department, score);  
studentController.addStudent(newStudent);  
}
```

```
private void listStudents() {  
    List<Student> studentList = studentController.getAllStudents();  
    if (studentList.isEmpty()) {  
        System.out.println("No student records available.");  
    } else {  
        System.out.println("\n--- Student Records ---");  
        for (Student student : studentList) {  
            System.out.println(student);  
        }  
    }  
}
```

```
private void modifyStudent() {  
    System.out.print("Enter Student ID to update: ");  
    int studentId = inputScanner.nextInt();  
    inputScanner.nextLine(); // Consume newline  
    System.out.print("Enter Updated Name: ");  
    String updatedName = inputScanner.nextLine();  
    System.out.print("Enter Updated Department: ");  
    String updatedDepartment = inputScanner.nextLine();  
    System.out.print("Enter Updated Marks: ");  
    int updatedScore = inputScanner.nextInt();
```

```

        Student updatedStudent = new Student(studentId, updatedName, updatedDepartment, updatedScore);
        studentController.updateStudent(updatedStudent);
    }

    private void removeStudent() {
        System.out.print("Enter Student ID to remove: ");
        int studentId = inputScanner.nextInt();
        studentController.deleteStudent(studentId);
    }
}

```

Controller

```

import java.sql.*;
import java.util.ArrayList;
import java.util.List;

public class StudentController {

    private static final String DB_URL = "jdbc:mysql://localhost:3306/javadb";
    private static final String DB_USER = "root";
    private static final String DB_PASSWORD = "karan.111";

1.3 Hard Problem

Learning Outcomes:

1. **Integrating Java with Databases** – Learn how Java applications interact with databases to store and retrieve data efficiently.
2. **Enhancing Data Security** – Explore best practices for securing database connections and preventing SQL injection attacks in Java applications.
3. **Optimizing Query Performance** – Understand how to write efficient SQL queries and use indexing to improve database performance.
4. **Building Scalable Applications** – Learn how to design a Java-based system that can handle increasing data loads while maintaining performance.
